

Q1.Problem on class and object Task Write a Person class with an instance variable, age, and a constructor that takes an integer, initialAge,as a parameter. The constructor must assign initialAge to age after confirming the argument passed as initialAge is not negative;
if a negative argument is passed as initialAge,the constructor should set age to 0 and print Age is not valid,setting age to 0. In addition, you must write the following instance methods: 1.yearPasses() should increase the age instance variable by 1

1. amIOld() should perform the following conditional actions:
- If age < 13, print You are young..
 - If age > 13 and age < 18, print You are a teenager
 - Otherwise, print You are old..

Input Format The first line contains an integer,T(the number of test cases), and the T subsequent lines each contain an integer denoting the age of a Person instance.

```
In [1]: class Person:
def __init__(self,initialAge):
    self.age=initialAge
    # Add some more code to run some checks on initialAge
def amIOld(self):
    if self.age<0:
        print("Age is not valid,setting age to 0.")
        self.age=0
    elif self.age<13:
        print("You are young.")
    elif self.age>=13 and self.age<18:
        print("You are a teenager.")
    else:
        print("You are old.")
    # Do some computations in here and print out the correct statement to the console
def yearPasses(self):
    self.age+=1
    # Increment the age of the person in here

t = int(input())
for i in range(0, t):
    age = int(input())
    p = Person(age)
    p.amIOld()
    for j in range(0, 3):
        p.yearPasses()
    p.amIOld()
    print("")
```

```
4
-1
Age is not valid,setting age to 0.
You are young.

10
You are young.
You are a teenager.

16
You are a teenager.
You are old.

18
You are old.
You are old.
```

Q2.Problem on Inheritance Task You are given two classes, Person and Student, where Person is the base class and Student is the derived class. Completed code for Person and a declaration for Student are provided for you in the editor. Observe that Student inherits all the properties of Person. Complete the Student class by writing the following: • A Student class constructor, which has 4 parameters:

1. A string, firstName.
2. A string, lastName.
3. An integer, id.
4. An integer array (or vector) of test scores, scores. • A char calculate() method that calculates a Student object's average and returns the grade character representative Of their calculated average image-2.png he first line contains firstName,lastName and idNumber, separated by a space. The second line contains the number of test scores. The third line of space-separated integers describes scores .

```
In [2]: class Person:
# Write your code here
pass

class Student(Person):
# Class Constructor
#
# Parameters:
# firstName - A string denoting the Person's first name.
# lastName - A string denoting the Person's last name.
# id - An integer denoting the Person's ID number.
# scores - An array of integers denoting the Person's test scores.
#
# Write your constructor here
def __init__(self,firstName, lastName, idNum, scores):
    self.firstName=firstName
    self.lastName=lastName
    self.idNum=idNum
    self.scores=sum(scores)/len(scores)

# Function Name: calculate
def calculate(self):
    if self.scores>=90 and self.scores<=100:
        return 'O'
    elif self.scores>=80 and self.scores<90:
        return 'E'
    elif self.scores>=70 and self.scores<80:
        return 'A'
    elif self.scores>=55 and self.scores<70:
        return 'P'
    elif self.scores>=40 and self.scores<55:
        return 'D'
    elif self.scores<40:
        return 'T'
# Return: A character denoting the grade.
#
# Write your function here
def printPerson(self):
    print(f"Name: {self.lastName}, {self.firstName}")
    print(f"ID: {self.idNum}")

line = input().split()
firstName = line[0]
lastName = line[1]
idNum = line[2]
numScores = int(input()) # not needed for Python
scores = list( map(int, input().split()) )
s = Student(firstName, lastName, idNum, scores)
s.printPerson()
print("Grade:", s.calculate())
```

```
Heraldo Memelli 8135627
2
100 80
Name: Memelli, Heraldo
ID: 8135627
Grade: O
```
